# Dashboards and static insights

Previously, you learned about data storytelling and interpreting your dataset through a narrative. In this reading, you will explore the importance of using dashboards and static insights to make your data even clearer.

Dashboards and **static insights** allow the client or user to be able to have control of their narrative. With dashboards, anyone can use the data and make their own determinations. A dashboard can be built on top of static insights or **static data**, which is data that doesn't change once it has been recorded. This allows you to tightly control the narrative and the way that your data is presented visually, whether via graphs, charts, etc.

Live vs. static

Identifying whether data is live or static depends on certain factors:

- How old is the data?
- How long until the insights are stale or no longer valid to make decisions?
- Does this data or analysis need updating on a regular basis to remain valuable?

Static data

Static data involves providing screenshots or snapshots in presentations or building dashboards using snapshots of data. There are pros and cons to static data.

PROS

- Can tightly control a point-in-time narrative of the data and insight
- Allows for complex analysis to be explained in-depth to a larger audience

CONS

- Insight immediately begins to lose value and continues to do so the longer the data remains in a static state
- Snapshots can't keep up with the pace of data change

Live data

Live data means that you can build dashboards, reports, and views connected to automatically updated data.

PROS

- Dashboards can be built to be more dynamic and scalable
- Gives the most up-to-date data to the people who need it at the time when they need it
- Allows for up-to-date curated views into data with the ability to build a scalable "single source of truth" for various use cases
- Allows for immediate action to be taken on data that changes frequently
- Alleviates time/resources spent on processes for every analysis

CONS

- Can take engineering resources to keep pipelines live and scalable, which may be outside the scope of some companies' data resource allocation
- Without the ability to interpret data, you can lose control of the narrative, which can cause data chaos (i.e. teams coming to conflicting conclusions based on the same data)
- Can potentially cause a lack of trust if the data isn't handled properly

Key takeaways

Analysts need to familiarize themselves with the business and data so they can recommend when an updated static analysis is needed or should be refreshed. Also, this data insight will help you make the case for what sorts of analyses, visualizations, and additional data are recommended for the types of decisions that the business needs to make. For more information on dashboards, keep this survey on hand as it will be useful for the following video.
